Features we do not model

When a document leans on layout features the converter has never seen, the page falls apart in instructive ways. This paragraph opens with a three-line drop cap frame; the lines beside it must shorten to make room, and the fourth line returns to the full measure. Word computes the cap's frame from the line count, not from any stored height, so the only way to match it is to model the rule. The text keeps going for a few more lines so that the return to full width is visible on the page and the wrap can be measured against the reference without ambiguity.

Linked text boxes. Everything that does not fit in this first box continues in the second box to the right, because the two share one story.

This second paragraph should already be in the right-hand box in Word. A converter that ignores the link either clips it here or lets it overflow the bottom edge of the first box.

Ruby text: the capital of Japan is 東京(とうきょう) and the guide text above it is 5.5pt. The rest of the line is plain.

Fit text: s t r e t c h e d t o 3 . 5 i n c h e s | ends here.

Donaudampfschifffahrtsgesellschaftskapitän Rindfleischetikettierungsüberwachungsaufgabenübertragungsgesetz Kraftfahrzeughaftpflichtversicherung ends.

This paragraph suppresses line numbers. Word leaves the gutter empty beside both of its lines and keeps counting on the next paragraph as if these lines did not exist at all.

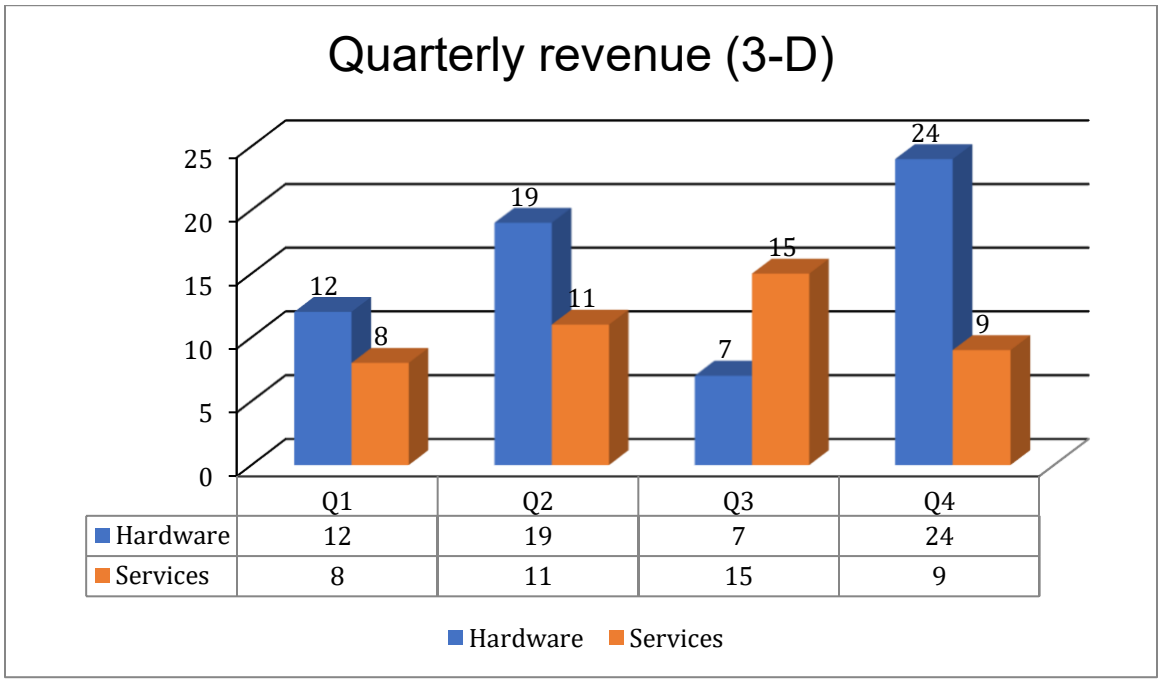

Numbering resumes on this paragraph. Its first line should carry the number that follows the last numbered line above the suppressed paragraph.

R1C3 third	R1C2 second	R1C1 first
R2C3 third	R2C2 second	R2C1 first

Above: bidiVisual table, so 'first' sits in the rightmost column in Word.

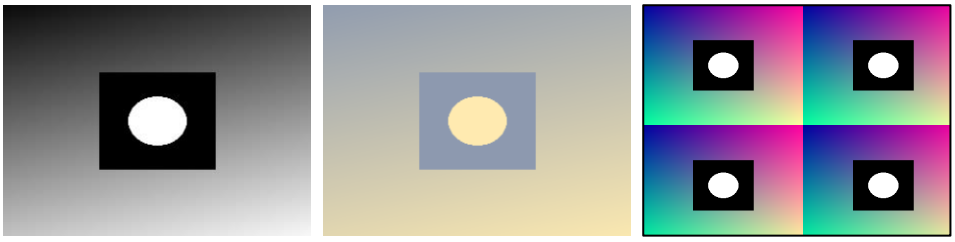

No-wrap cell keeps this whole sentence on one line	The other column takes what is left and wraps as often as it must, which with a no-wrap neighbour is quite often indeed.
f i t	tcFitText spreads 'fit' across the whole cell to the left.
